25

- 1. A sheet-state ink-jet recording material which comprises a water-resistant support and at least one ink-receptive layer provided on the support, wherein at least one of the ink-receptive layers contains inorganic fine particles having an average primary particle size of 30 nm or less and a hydrophilic binder, and a longitudinal direction of the sheet-state ink-jet recording material is cut at a right angle to a flowing direction of the recording material at a time of coating the ink-receptive layer.
- 2. The sheet-state ink-jet recording material according to Claim 1, wherein the water-resistant support is a polyolefin resin-coated paper support.

3. The sheet-state ink-jet recording material according to Claim 2, wherein the polyolefin resin-coated paper support has a subbing layer having a solid content-coated amount of 10 to 500 mg/m^2 .

4. The sheet-state ink-jet recording material according to Claim 2, wherein the polyolefin resin-coated paper support has a subbing layer having a solid content-coated amount of 20 to $300~\text{mg/m}^2$.

5. The sheet-state ink-jet recording material according to Claim 2, wherein the polyolefin resin-coated paper support has a water content of 6% or more.

30 6. The sheet-state ink-jet recording material according to Claim 2, wherein the polyolefin resin-coated paper support is a support wherein both surfaces of a base paper are covered by a polyethylene resin layer, the polyethylene resin layer at the side on which an ink-receptive layer is provided comprises 90% by weight or more of a low density polyethylene resin having a density of 0.930 g/cm³ or less based on the total resin, and

the polyethylene resin layer at the side opposed to the above side comprises 30% by weight or more of a high density polyethylene resin having a density of $0.950~\rm g/cm^3$ or more based on the total resin.

- 7. The sheet-state ink-jet recording material according to Claim 2, wherein the polyolefin resin-coated paper support is a support wherein both surfaces of a base paper are covered by a polyethylene resin layer, the polyethylene resin layer at the side on which an ink-receptive layer is provided comprises 90% by weight or more of a low density polyethylene resin having a density of 0.930 g/cm³ or less based on the total resin, and the polyethylene resin layer at the side opposed to the above side comprises 50% by weight or more of a high density polyethylene resin having a density of 0.950 g/cm³ or more based on the total resin.
- 8. The sheet-state ink-jet recording material according to Claim 1, wherein the inorganic fine particles are contained in the ink-receptive layer in an amount of 50% by weight or more based on the total solid content of the ink-receptive layer.
- 9. The sheet-state ink-jet recording material according to Claim 1, wherein the inorganic fine particles are contained in the ink-receptive layer in an amount of 60% by weight or more based on the total solid content of the ink-receptive layer.
- 10. The sheet-state ink-jet recording material according to Claim 1, wherein the ink-receptive layer contains the inorganic 30 fine particles in an amount of 8 g/m² or more.
 - 11. The sheet-state ink-jet recording material according to Claim 1, wherein the ink-receptive layer contains the inorganic fine particles in an amount of 10 to 30 g/m^2 .

35

12. The sheet-state ink-jet recording material according to

Claim 1, wherein the inorganic fine particles have an average secondary particle size of 50 to 300 nm.

- 13. The sheet-state ink-jet recording material according to Claim 1, wherein the inorganic fine particles are at least one selected from the group consisting of fumed silica and alumina hydrate.
- 14. The sheet-state ink-jet recording material according to 10 Claim 1, wherein a weight ratio of the hydrophilic binder to the inorganic fine particles is 0.4 or less.
- 15. The sheet-state ink-jet recording material according to Claim 1, wherein a weight ratio of the hydrophilic binder to the inorganic fine particles is 0.3 or less.
 - 16. The sheet-state ink-jet recording material according to Claim 1, wherein the ink-receptive layer contains a hardener of the hydrophilic binder.
 - 17. The sheet-state ink-jet recording material according to Claim 16, wherein the hardener is boric acid or a borate.
- 18. The sheet-state ink-jet recording material according to Claim 1, wherein the hydrophilic binder is polyvinyl alcohol having an average polymerization degree of 2500 to 5000.
- 19. The sheet-state ink-jet recording material according to Claim 1, wherein the sheet-state ink-jet recording material has 30 a length to a longitudinal direction of 300 mm or shorter.
 - 20. The sheet-state ink-jet recording material according to Claim 1, wherein the sheet-state ink-jet recording material has a length to a longitudinal direction of 200 mm or shorter.
